12.5. Results of PBT and vPvB assessment

SHUFILL HOOFPACKING GREEN SHORE MEDIUM (A) 660GR / 21/2 KG

Results of PBT assessment

Dodecamethylcyclohexasiloxane (D6) meets the current criteria of Annex XIII of the EU REACH Regulation for very persistent and very bioaccumulative substances (vPvB) and is included in the Candidate List of Substances of Very High Concern (SVHC). However, according to our knowledge of the art, D6 cannot be compared with known persistent, bioaccumulative and toxic (PBT) and / or vPvB substances. The interpretation of the available data by the silicone industry shows that scientific evidence obtained from field trials essentially indicates that D6 does not lead to biomagnification in aquatic and terrestrial food chains. In air, D6 is broken down by naturally occurring processes in the atmosphere. D residues that do not decompose in air in this way are not expected to accumulate from the air in water, soil or organisms.

Decamethylcyclopentasiloxane (D5) meets the current criteria set out in Annex XIII of the EU REACH Regulation for vPvB substances and is included in the Candidate List of SVHCs. However, according to our prior art knowledge, D5 is not comparable to known PBT and / or vPvB substances. The interpretation of the available data by the silicone industry shows that scientific evidence obtained from field trials essentially indicates that D5 does not lead to biomagnification in aquatic and terrestrial food chains. In air, D5 is broken down by naturally occurring processes in the atmosphere. D residues that do not decompose in air in this way are not expected to accumulate from the air in water, soil or living organisms.

Octamethylcyclotetrasiloxane (D4) meets the current criteria as set out in Annex XIII of the EU REACH Regulation for PBT and vPvB substances and is included in the Candidate List of SVHCs. However, according to our prior art knowledge, D4 is not comparable to known PBT and / or vPvB substances. The silicone industry's interpretation of the available data indicates that scientific evidence obtained from field trials essentially indicates that D4 does not lead to biomagnification in aquatic and terrestrial food chains. In air, D4 is broken down by naturally occurring processes in the atmosphere. D residues that do not decompose in air in this way are not expected to accumulate from the air in water, soil or living organisms.
